

TODO for next deliverable:

I believe that we are basically finished with Spike prototypes for the time being. If we run into something large that we need a spike for, we will use it. However the past deliverables have been basically entirely spike prototypes, including ID2. This is why there is no actual testing.

The main focus for the next deliverable is taking the class diagrams developed by the design team and have the implementation team actually build the project itself. During this stage, we will make use of issue tracking and extensive testing. For the next deliverable, we will have had the Testing and Implementation teams working together to pair program, in order to increase the testers' understanding of the program, have multiple eyes looking at possible issues as they are written, and we will have the testers begin building the testing suite described in the testing plans document.

In the past, the mini-milestones have been largely vocalized, but I will have a meeting planned for tomorrow with the team leads during class-time to finalize what we can expect to get done for ID3 and make a list of mini-milestones and corresponding due dates, now that we have a much better idea of what technologies we will use, and how difficult certain things are going to be.
