

Formal Code Review on Mar. 26th

Reviewing Shane's deployManager.py, deployWorker.py, selenium_setup.sh, .travis.yml

Reviewed by Connor, Matt, Corey, Darwin

deployManager.py

- Global variable could be changed
- Discussed the loop on how things get deployed
 - All cases are covered
- Pseudo comments the user will be prompted for their password
- Overall pretty good

deployWorker.py

- Discussed the different functions
- Possible comments for the different variables
- Took out old demo (good so our main website pointed to latest deployment)
- Comments for which args are being passed in
- Possibly change global or them being passed
- In the future, may want to remove credentials from the repo (if the project goes public with everything, then the credentials will be posted)
- Possible more comments for more functions
- Could include JSdoc run script in the deploy scripts

selenium_setup.sh, .travis.yml

- One of the chrome installations work (and one doesn't, could remove the extra one)
- Looks good
